

Evening Energy Trading Evaluator

PUBLIC SAMPLE OUTPUT / SYNTHETIC DATA ONLY

From schedule to contribution

An illustrative 80 MW schedule for six hours daily across 30 days produces 14.4 million kWh. At an illustrative Rs.9.20/kWh, its gross energy value is Rs.13.248 crore. Gross energy value is distinct from trader earnings.

The scenario allocates 3 paise/kWh to the lead trader and 4 paise/kWh to a partner trader within a selected 7-paise chain ceiling. This is a demonstration of entered assumptions, not an applicable-law determination or a commercial quote.

Scenario	Energy MU	Gross margin lakh INR	Costs lakh INR	Contribution lakh INR
Flat supply	14.4	4.32	3	1.32
Higher funding cost	14.4	4.32	5.25	-0.93
Network limited	10.8	3.24	3	0.24

What the comparison reveals

Funding costs can erase an otherwise positive margin. A 100 MW residual gap can be constrained to 60 MW by entered network capacity, reducing scheduled energy to 10.8 MU. An allocation above the selected chain ceiling produces an invalid-allocation warning and withholds contribution outputs.

Scope and limitations

All quantities, prices and costs are synthetic. No actual customer, procurement requirement, network entitlement, source availability or approved transaction is represented. Costs are scenario totals rather than a forecast. This output does not establish maximum net profit or regulatory approval.
